Introduction
Key themes

• The pandemic remains intense in the U.S. and Europe, but the early arrival of vaccines suggests the health crisis will wane in the months ahead.
• U.S. monetary and fiscal policies continue to be exceptionally effective in mitigating macroeconomic damage.
• Macroeconomic forecasts suggest very strong U.S. real GDP growth for all of 2021.
• Downside risk remains, and continued execution of a granular, risk-based health policy will be critical to maintain economic momentum.
Health Crisis Is Expected to Wane
Fatality rates and economic activity

• The global health crisis requires continued daily management.
• Daily fatalities per 100,000 population remain near the highest levels of the pandemic in both Europe and the U.S.
• East Asia and Pacific countries continue to report daily fatalities per 100,000 population that are an order of magnitude lower than those of the U.S. and Europe.
• Key areas of global production must maintain safety protocols but are poised to bring the pandemic under control.
Pandemic remains intense in the U.S. and Europe

Sources: Center for Systems Science and Engineering at Johns Hopkins University, Centers for Disease Control and Prevention and author’s calculations. Last observation: Feb. 1, 2021. For this chart, the East Asia and Pacific region consists of Australia, China, Indonesia, Japan, Malaysia, Myanmar, New Zealand, Philippines, Singapore, South Korea, Taiwan and Thailand.
But U.S. fatalities expected to fall

Fatalities skew toward older citizens

Death Rates for COVID-19 vs. Accidental Injuries

Death rate (per 100,000)

- COVID-19
- Accidental injuries: 2018 data

Vaccines will help bring the crisis to a close

• Vaccine distribution is being directed toward those most vulnerable to COVID-19.
• This suggests declining fatalities in the months ahead, even before the pandemic comes under more complete control.
• Virus mutation that renders current vaccines ineffective poses a tangible risk to this scenario.
Effective Monetary and Fiscal Policies
A policy rate cut and increased liquidity

- U.S. monetary and fiscal policies have been exceptionally effective during the crisis.
- Monetary policy included lowering the policy rate to the effective lower bound and providing liquidity to financial markets through a variety of programs supported by the U.S. Treasury.
- The backstop programs stemmed an incipient financial crisis during the March-April time frame, to the point where current levels of financial stress are at pre-pandemic levels.
Financial stress has abated

Fiscal policy response to the pandemic

• In the first 11 months of 2020, U.S. fiscal policy included the CARES Act along with additional legislation. In total, this fiscal policy response was valued at about $3.148 trillion.*

• The fiscal response drove personal income up to an all-time high in the second quarter, the opposite of normal recession dynamics.

• In addition, the Consolidated Appropriations Act of 2021 signed into law on Dec. 27, 2020, includes an additional $900 billion in pandemic relief.

* See the International Monetary Fund’s Policy Responses to COVID-19 and the Committee for a Responsible Federal Budget’s estimates of the cost of President Trump’s executive orders.

U.S. Recovery Far Ahead of Schedule
Labor markets continue to improve

- Employment has rebounded more rapidly than expected, supporting the idea that many layoffs were temporary as firms adjusted to the pandemic.
- Hall and Kudlyak (2020), in particular, have emphasized that the temporary layoff category of unemployment has been dramatically more important in this recession as compared with previous recessions.*
- As a result, the U.S. labor market recovery is about four years ahead of where it was following the 2007-09 recession.

Unemployment declining more rapidly than after the previous peak

Unemployment driven by temporary layoffs

The percent of the unemployed self-reporting as “on temporary layoff” is normally only 10-15%, but today is at 28.4%.
Potential unemployment declines

• A back-of-the-envelope calculation suggests that there is room for further decline in the official unemployment rate in the months ahead.

• If all those unemployed identifying as “on temporary layoff” are simply recalled and nothing else changes, the official unemployment rate would decline to 4.8%.

• If the “on temporary layoff” category returns to a normal value (e.g., 1 million workers) and nothing else changes, the official unemployment rate would still decline to 5.4%.

• The median U.S. unemployment rate in the postwar era is 5.6%

Inflation Expectations Recovering Toward Inflation Target
Inflation expectations improving

Market-Based Inflation Expectations with a CPI-to-PCE Adjustment

Aug. 27, 2020: Chair Powell announces new policy framework
2% inflation target

Inflation expectations moving higher

• Market-based inflation expectations have recovered from lows reached during March 2020.

• The FOMC’s new policy framework, announced in Chair Powell’s 2020 Jackson Hole speech, has likely encouraged some of this movement.

• The chart indicates that TIPS-based breakeven inflation, based on CPI inflation measures, could move considerably higher and still be consistent with a PCE inflation outcome modestly above the 2% target.

• This would be a welcome development for the FOMC, as inflation has generally been below target for many years.
Conclusion
Light at the end of the tunnel

• The early arrival of vaccines suggests that the global pandemic will wane during the first half of 2021.

• In the U.S., monetary and fiscal policies have been especially aggressive, and the associated macroeconomic outcomes have been considerably better than originally expected at the pandemic onset.

• Aggregate resources available to fund consumption continue to be exceptionally high, suggesting continued recovery in the first half of 2021.

• Downside risk remains, and continued execution of a granular, risk-based health policy will be critical in the months ahead.
